1) Générer un fichier XML

Pour qu'un document soit conforme au format factur-x (conforme aussi à la norme EN16931), il faut que le fichier XML en pièce jointe soit conforme au CII (Cross Industry Invoice)

Le CII est une norme internationale créer par l'UNECE (Commission économique pour l'Europe des Nations unies) pour les factures, rendant la facturation plus facile entre différentes entreprises. Il simplifie les processus, réduit les erreurs et accélère les paiements. En normalisant les données, il améliore la visibilité financière et aide les entreprises à être plus efficaces, économiser des ressources et respecter les règlements.

https://unece.org/trade/uncefact/e-invoice

Prérequis:

- Microsoft SQL server management studio
- Installé les Library python suivant :

```
pip install pyodbc
pip install PyPDF2
pip install logging
pip install dateTime
```

On a une base de données contenant les données des factures :

Tout d'abord, j'ai commencé par examiner le fichier XML pour répertorier les données importantes, ensuite je cherche ces données dans la base de données, puis je crée un programme qui place les données dans un modèle de fichier XML conforme au format Factur-X, et enfin le programme génère le fichier XML.

On peut trouver des exemples de fichiers sous format factur-x sur : https://fnfe-mpe.org/factur-x-et-zugferd-2-2/

Documents indiquant la signification des balises :

https://www.impots.gouv.fr/specifications-externes-b2b

Version 2.3 du 31/07/2023:

Télécharger les documents : Dossier de spécifications externes de la facturation électronique, annexes et swaggers (.zip)

Recherches des valeurs dans les tables :

Les valeurs dans les cases rouges sont les valeurs qui se répètent.

- 1. Par produits
- 2. Par taux de tva (0%, 5,5%, 20%)

    FAVE.NoFacture DESC
```

Voici un exemple:

Comme on a maintenant les données, il faut récupérer le numéro de la facture. On parcourt le fichier pour retrouver du texte que ressemble à ce format : "FAXX/XXXXX"

```
def getNoFacture(pdf_path,file_path,errorPath):
    text = ""
    with open(pdf_path, 'rb') as file:
        reader = PyPDF2.PdfReader(file)
        for i in range(len(reader.pages)):
            page = reader.pages[i]
            text += page.extract_text()
    if re.findall(r"FA \d{2}/\d{5}",text):
        return re.findall(r"FA \d{2}/\d{5}",text)[0].replace(' ','')
    else :
        destination_path = os.path.join(errorPath, os.path.basename(file_path))
        shutil.move(file_path, destination_path)
        print("err " + pdf_path + f"\n numéro de facture pas trouvé")
        logErr.error(pdf_path + f"\n numéro de facture pas trouvé")
        log.error(pdf_path + f"\n numéro de facture pas trouvé")
        return False
```

Puis on récupère les données sur python :

```
Récupération des données à partir de la base de données
def getData(noFacture):
       sqlCommand=''' commande sql
       server = 'PC-02095' #à modifier
       database = 'SILOG' #à modifier

                         log.error(error_message)
                         return False
```

L'entreprise envoie certaines factures à lui-même, donc on ne va pas générer le fichier xml, on va le déplacer le fichier PDF dans un dossier

```
N° client : 08087
N° TVA : FR08087

Adresse destination Finale / Final destination address
COMMANDES POUR LE MAGASIN
Rue de l'abbaye
21150 Flavigny sur Ozerain
France
```

Donc on crée aussi cette fonction suivante :

```
def verifClient(data,file_path):
    notSentPath = r"C:\temp\v4\factures\notSent"
    data = data[0]
    if data['CodeClient'] == '08087':
        shutil.move(file_path, notSentPath)
        return False
    else:
        return True
```

Exemple:

Ensuite, nous allons insérer les données dans des balises XML en utilisant ce fichier comme format :

On va tout d'abord gérer les balises qui se répète.

Pour les produits, on parcourt la liste data et on place les données dans les balises xml:

```
def setProduit(data):
    xmlProd =
    for i, row in enumerate(data):
       xmlProd += f''
           <ram:IncludedSupplyChainTradeLineItem>
               <ram:AssociatedDocumentLineDocument>
                   <ram:LineID>{i+1}</ram:LineID>
               </ram:AssociatedDocumentLineDocument>
               <ram:SpecifiedTradeProduct>
                   <ram:GlobalID schemeID="0160">{row['GlobalID']}</ram:GlobalID>
                   <ram:Name>{row['NameItem']}</ram:Name>
               </ram:SpecifiedTradeProduct>
               <ram:SpecifiedLineTradeAgreement>
                       <ram:ChargeAmount>{row['ChargeAmount']}</ram:ChargeAmount>
       if row['ReducedValue'] != '0.00':
           xmlProd += f'''
               <ram:AppliedTradeAllowanceCharge>
                   <ram:ChargeIndicator>
                       <udt:Indicator>false</udt:Indicator>
                   </ram:ChargeIndicator>
                   <ram:ActualAmount>{row['ReducedValue']}</ram:ActualAmount>
               </ram:AppliedTradeAllowanceCharge>
       xmlProd +=f'''
                   </ram:GrossPriceProductTradePrice>
                   <ram:NetPriceProductTradePrice>
                       <ram:ChargeAmount>{row['ChargeAmountReduced']}</ram:ChargeAmount>
                   </ram:NetPriceProductTradePrice>
               </ram:SpecifiedLineTradeAgreement>
               <ram:SpecifiedLineTradeDelivery>
                   <ram:BilledQuantity</pre>
unitCode="C62">{int(row['BilledQuantity'])}</ram:BilledQuantity>
               </ram:SpecifiedLineTradeDelivery>
               <ram:SpecifiedLineTradeSettlement>
                   <ram:ApplicableTradeTax>
                   <ram:TypeCode>VAT</ram:TypeCode>
                   <ram:CategoryCode>S</ram:CategoryCode>
                   <ram:RateApplicablePercent>{'%.2f' %
<ram:SpecifiedTradeSettlementLineMonetarySummation>
                   <ram:LineTotalAmount>{row['LineTotalAmount']}</ram:LineTotalAmount>
                   </ram:SpecifiedTradeSettlementLineMonetarySummation>
               </ram:SpecifiedLineTradeSettlement>
           </ram:IncludedSupplyChainTradeLineItem>
   return xmlProd
```

Pour les taux de tva, c'est plus complexe, on répète chaque balise par le taux de tva différent.

Ex:

BasisAmount: somme du prix HT par taux de tva

CalculatedAmount: (BasisAmount*taux_tva)/100, montant TVA

PS C:\temp\factures> & C:\Users\ofoster\AppData\Local\Microsoft\WindowsApps\python3.11.exe c:\temp\factures\getXML.py ({'20.0000': {'SumProduits': 251.64, 'TotalTVA': 50.32799999999999}}, 50.3279999999999)
PS C:\temp\factures>

Type	eTVA:
Sur	mProduits
Tota	alTVA
Total	l TVA

Fonction pour créer les balises :

```
def setTva(data):
    xmlTVA = '
    # Obtenir les types de TVA et les valeurs associées pour les données fournies
    typeTVA = getTVA(data)[0]
    for vat_type, values in typeTVA.items():
        # Construction de la section XML pour chaque type de TVA
        xmlTVA += f'''
            <ram:ApplicableTradeTax>
                <ram:CalculatedAmount>{'%.2f' %
float(values['TotalTVA'])}</ram:CalculatedAmount>
                <ram:TypeCode>VAT</ram:TypeCode>
                <ram:BasisAmount>{values['SumProduits']}</ram:BasisAmount>
                <ram:CategoryCode>S</ram:CategoryCode>
                <ram:DueDateTypeCode>5</ram:DueDateTypeCode>
                <ram:RateApplicablePercent>{vat type}</ram:RateApplicablePercent>
            </ram:ApplicableTradeTax>
   return xmlTVA
```

On a donc tous ce dont on a besoin pour générer le fichier xml.

```
def setXML(data):
    #récupérer la valeur de TVA
    valTVA = getTVA(data)[1]
    row = data[0]
    xmlCode=f'''<?xml version='1.0' encoding='UTF-8'?>

   return xmlCode
```

Finalement, Il faut générer le fichier xml

```
xmlCode = setXML(data)
with open(xmlPath, 'w', encoding='utf-8') as xmlFile:
    xmlFile.write(xmlCode)
```

Résultat:

Code en entier:

```
import glob
import os
import pyodbc
import re
import PyPDF2
import shutil
explication du programme:
On récupère les données essentiels dans la base de données
On place les données dans du code xml pour le générer ensuite
Dans le code xml, il y a des balises qui se répète:
 par produit
  par type de taxe tva (0, 5.5, 20, etc...)
